Opis produktu

Airborne headphone extension

GA-PPJ is an extension to the GAPILOT production air headphones.

If the standard cable from the air headphones is too short, then the extension of our company can be a solution to this problem.

For example, you might want to use a extension extension. If the intercom slots are located on the front of the console and the headphones that they wish to use, the passengers travelling on the rear seat of the aeroplane have too short a cable to be able to connect them to the intercom.

You can also use the extension cord when the intercom slot on the plane is at the top or the rear, and we have headphones that are equipped with a Bluetooth module or a module with a volume control on the line. In order to be able to use the module on the cable in the course of the flight without having to turn the head off, we can apply the extension cord between the headphones and the intercom sockets.

The extension cord is compatible with all air headphones equipped with PJ plugs.

The extension cord consists of two PJ-gold-gold plugs connected to the chassis with two PJ sockets.

We produce a standard extension in 4 lengths of 1.0 m 1.5 m 2.0 m and 3.0 meters.

Of course there is a possibility that we will carry out a extension of another length e.g.: 2.60 meters.
